                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBUNIT: MODGE.

DOMAIN: THE FIBENONECTIN TYPE-I DOWAIN MEDIATES BINDING TO FIBRIN, AND THE KINGLE DOMAIN APPARENTLY MEDIATES FIBRIN-INDUCED STIMULATION OF ACTIVITY.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
SIMILARITY: Contains 1 EGF-like domain.
SIMILARITY: Contains 1 fibronectin type I domain.
SIMILARITY: Contains 1 fibronectin type I domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Plasminogen activators from the saliva of Desmodus rotundus (common

"The structure of the TATA-less rat tissue-type plasminogen activator gene. Species-specific sequence divergences in the promoter predict differences in regulation of gene expression.";
J. Biol. Chem. 265:2022-2027(1990).
-:- FUNCTION: CONVERTS THE ABUNDAY. BUT INACTIVE, ZYMOGEN PLASMINOGEN TO PLASMIN BY HYDROLYZING A SINGELE ARG-VAL BOND IN PLASMINOGEN. BY CONTROLLING PLASMIN-MEDIATED PROTEOLYSIS, IT PLAYS AN IMPORTANT ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND MANY OTHER PHYSIOPATHOLOGICAL EVENTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                -:- SUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.
-:- FTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE BNZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY PLASNIN, TISSUE KALLITREIN OR FACTOR XA.
-:- MISCELLANEOUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A CHAIN. BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.
-:- SIMILARITY: BELOANGS TO PEPTIDASE FAMILY SI.
-:- SIMILARITY: Contains 1 EGF-like domain.
-:- SIMILARITY: Contains 2 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                 CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin. SUBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                               Ny T., Leonardsson G., Hsueh A.J.W.; "Cloning and characterization of a cDNA for rat tissue-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         InterPro; IPR001314; Chymotrypsin.

Schleuning W.D., Bode W.;

"Catalytic domain structure of vampire bat plasminogen activator: a
molecular paradigm for proteolysis without activation cleavage.";

Biochemistry 36:13489-13493(1997)

-!- FUNCTION: PROBABLY ESSENTIAL TO SUPPORT THE FEEDING HABITS OF THIS

EXCLUSIVELY HARMYTOPHAGOUS ANIMAL. POTENT THROMBOLYTIC AGENT.

-:- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-val bond in
plasminogen to form plasmin.

-:- RNZYME REGULATION: ACTIVITY TOWARD PLASMINOGEN IS STIMULATED IN
THE PRESENCE OF FIBRIN I.

                                                                                       -:- SUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.
-:- FTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-314 CATALYZED BY PLASMIN, TISSUB KALLIKREIN OR FACTOR XA.
-:- MISCELLANEOUS: BINDS TO THE KINGLE STRUCTURE OF THE FIBRIN A CHAIN. BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.
-:- SIMILARITY: COLLAINS I BGF-11ke domain.
-:- SIMILARITY: Contains I fibronectin type I domain.
-:- SIMILARITY: Contains 2 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              TO PLASMIN BY HYDROLYZING A SINGLE ARG-VAL BOND IN PLASMINOGEN. ECONTROLLING PLASMIN-MEDITAD PROTECLYSIS, IT PLAYS AN IMPORTANT ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND MANY OTHER PHYSIOPATHOLOGICAL EVENTS.

ANALYTIC ACTIVITY: Specific cleavage of Arg-|-val bond in plasminogen to form plasmin.

SUBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IISSUE-TYPE PLASMINOGEN ACTIVATOR B

THE INITIATION: FACTOR XII IS ASEUM GLYCOPROTEIN THAT PARTICIPATES IN GRAEBATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE GRNERATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE GRNERATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE CATALYTIC ACTIVITY: Cleaves selectively Arg-|-11e bonds in factor VII to form factor VIIa and factor XI to form factor XIa.

VII to form factor VIIa and factor XI to form factor XIa.

MISCELLANBOUS: FACTOR XII, PREKALLIKREIN, AND HWW KININOGEN FORM A COMPLEX BOUND TO AN ANIONIC SURFACE. PREKALLIKREIN IS CLEAVED BY FACTOR XII TO FORM KALLIKREIN, WHICH THEN CLEAVES FACTOR XII FIRST TO ALPHA-FACTOR XIIA AND THEN THEN CLEAVES FACTOR XII S CLEAVED BY CHALLIKREIN CLEAVES FACTOR XIIA AND THEN TO BETA-FACTOR XIII S CLEAVED ONLY TO ALPHA-FACTOR XIIA AS IT LACKS THE TRYPSIN/

KALLIKREIN CLEAVAGE SITE.

SIMILARITY: CONTAINS 1 fibronectin type I domain.

SIMILARITY: Contains 1 fibronectin type II domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. -!- PTM: N- and O-glycosylated. The N-glycans are complex biantennary structures present in either a mono- or disialylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuNAcalpha2-3Galbeta1-3GalNAc, with smaller amounts of disialylated and non-sialylated O-glycans also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WEDINE=9500201; PubMed=7918682; MEDINE=9500201; PubMed=7918682; MEDINE=95002201; PubMed=7918682; MEDINE=9500201; PubMed=7918682; Mainqle point mutation (Trp72--Arg) in human apo(a) kringle 4-37 associated with a lysine binding defect in Lp(a).", Biophys. Acta 1227.41-45 (1994)." (Lp(a).", Elophys. Acta main constituent of lipoprotein(a): (Lp(a)). It has serine proteinase activity and is able of autoproteolysis. Inhibits tissue-type plasminogen activator 1. Lp(a) may be a ligand for megalin/Gp 330.

Lp(a) may be a ligand for megalin/Gp 330.

DISFASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding. MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-fp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of SIMILARITY: Contains 38 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PRINTS; PRO0722; CHYMOTRYPSIN.

Submitted (JUL-2001) to the BMBL/GenBank/DDBJ databases.

-! FUNCTION: Receptor for Dickkopf protein. Cooperates with Dickkopf

-! FUNCTION: Receptor for Dickkopf protein. Cooperates with Dickkopf

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

-! SUBLIARITY: Contains 1 CUB domain.

-! SIMILARITY: Contains 1 WSC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27 NIHW--CN---CP-----KKFGGQHCEIDKSKT---CYEGNGHFYRGKASTDTMGR

```
Lp(a) may be a ligand for megalin/Gp 330.

-!- SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin and decorin (By similarity).

-!- PTM: N- and O-glycosylated (By similarity).

-!- DISEASE: Elevated plasma concentrations of apo(a) and its naturally occurring proteolytic fragments are correlated with atherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the tragments are competing with plasminogen for fibrin(ogen) binding.

-!- MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-Lp(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thromogenesis. O-glycosylation may limit the extent of proteolytic fragmentation (By similarity).

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Kremen protein 1 precursor (Kringle-containing protein marking the eye
                                                                                                                                                                                                                       Submitted (AUG-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for Dickkopf protein. Cooperates with Dickkopf to block Wnr/Deta-catenin signaling (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
-!- SUBLIARLIY: Contains I CUB domain.
-!- SIMILARLIY: Contains I Kringle domain.
-!- SIMILARLIY: Contains I WSC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GGCNAC. .) Kringle-containing transmembrane protein.";
Biochim. Biochim. Biophys. Acta 1518.63-72(2011).

C. I block Wnt/Deta-catenin signaling (By similarity).

C. SUBCELDIAR LOCATION: Type I membrane protein (Potential).

C. I SUBCELDIAR STAGE: In the embrane protein is first detected and ay 9 and increases up to day 18. Lower levels are found in adult. At 9.5 dpc, expression is lirst detected on day 9 and increases up to day 18. Lower levels are found in adult. At 9.5 dpc, expression is localised to the apical ectodermal ridge (AER) of the developing fore- and hindlimb buds, the telencephalon and the first brachial arch. At 10.5 dpc, expression is also observed in the myotome and in sensory tissues such as the nasal pit and optic vesicle.

C. SIMILARITY: Contains I Kringle domain.

C. SIMILARITY: Contains I Kringle domain.

L. FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS
C. FUNCTION: PLASMIN DISSOLVES THE PRINKIN OF UNDER DIASMINGEN
C. FUNCTION: PLASMIN DISSOLVES THE WALLS OF THE
BRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,
AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE
GRAAFIAN FOLLICLE. IT ACTIVATES THE UNDKINASE-TYPE PLASMINGEN
ACTIVATOR, COLLAGENASES AND SEVERAL COMPLENENT ZYMOGENS, SUCH
AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN,
C. ILAMININ AND VON WILLEBRAND FACTOR.

ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. CANNOT BE ACTIVATED WITH STREFPORINASE.
-i- PTM: N-LINKED GLYCAN CONTAIN N-ACETYLLACTOSAMINE AND SIALIC ACID.
O-LINKED GLYCANS CONSIST OF GAL-GALANC DISACCHRRIDE WITH IS
MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).
-i- MISCELLANGOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
-i- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI. PLASMINOGEN SUBFAMILY.
-i- SIMILARITY: CORTAINS 5 kringle domains.
